there were two main driving forces in my decision for preparing a question answer book covering all the courses given by myself during the past 10 years in my academic career first argument is that there exists a good amount of original questions in the exams and their corresponding answers

next my expectation is that probably fewer time would be spent in preparing such a book where the questions and answers are all ready prepared thereupon in this country most of the undergraduate students do not necessarily work on the course they attend in the same day instead they prefer to start preparing their exams 2 or 3 days before in these circumstances last minute students may usually prefer working on the passed questions for the tomorrow s exam however this method of preparation may lead unwanted consequences such that students mostly do not find same questions unconsciously learnt by heart in the exams in order to increase working efficiency and consequently reach to the maximum performance in exams will only be possible if students do not miss any lectures given by staff in addition to be an active participant during the lecture and daily work on the given homeproblems are the basic requirements for a full success in concluding this book will give a chance to the well prepared students to make a quick rehearsal before the exams for obtaining best results after the exams

materials scientists continue to develop stronger more versatile ceramics for advanced technological applications such as electronic components fuel cells engines sensors catalysts superconductors and space shuttles from the start of the fabrication process to the final fabricated microstructure ceramic processing covers all aspects of modern processing for polycrystalline ceramics stemming from chapters in the author s bestselling text ceramic processing and sintering this book gathers additional information selected from many sources and review articles in a single well researched resource the author outlines the most commonly employed ceramic fabrication processes by the consolidation and sintering of powders a systematic approach highlights the importance of each step as well as the interconnection between the various steps in the overall fabrication route the in depth treatment of production methods includes powder colloidal and sol gel processing as well as chemical synthesis of powders forming sintering and microstructure control the book covers powder preparation and characterization organic additives in ceramic processing mixing and packing of particles drying and debinding it also describes recent technologies such as the synthesis of nanoscale powders and solid freeform fabrication ceramic processing provides a thorough foundation and reference in the production of ceramic materials for advanced undergraduates and graduate students as well as professionals in corporate training or professional courses
